

Typenreihe SHC ÜBERHITZUNGSREGLER – OEM VERSION

PRODUKTDATEN

ALLGEMEINES

Elektronische Überhitzungsregler vom Typ SHC werden in Kompressionskälteanlagen und Wärmepumpen zur Ansteuerung von elektronischen Expansionsventilen EEV eingesetzt. Als Meßgrößen dienen im Allgemeinen der Saugleitungsdruck und die Temperatur des überhitzten Kältemittels. Geregelt wird die Kältemittel-Überhitzung am Verdampferausgang.

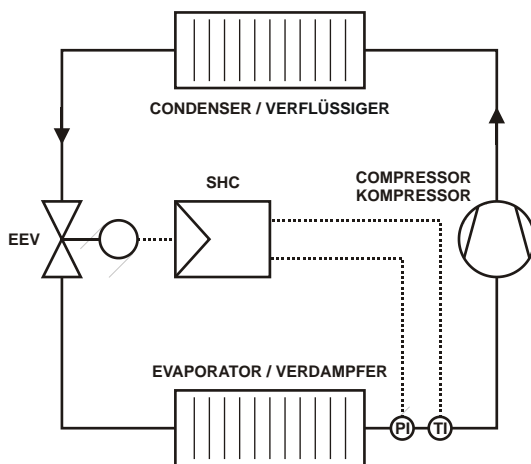

Abb. 1. Schematisches Diagramm

MERKMALE

- Automatische Adaption an die MSS des Verdampfers
- Ausregeln der minimal möglichen Überhitzung
- Lernendes Verhalten betreffend der Historie der Arbeitspunkte
- Automatische Nachführung der Reglerparameter
- Eigenständiges Erkennen des Abtauungsbedarfs
- Bedarfsgerechtes Einleiten des Abtauendes
- Kein externer Sollwert notwendig!

TECHNISCHE DATEN

Analogausgänge

Temperatur	2X (PT1000, NTC10K, NTC20K)
Temperatur/Spannung	2X (PT1000, NTC10K, NTC20K, 0,5 ... 4,5 V, 0 ... 10 V)
Spannung/Strom	2X (0,5 ... 4,5 V, 0 ... 10 V, 4 ... 20 mA)

Analogausgang

Spannung	1X (0 ... 10 V)
----------	-----------------

Schrittmotorausgänge

Für bipolaren Schrittmotor	4X (12 V oder 24 V, max. 800 mA pro Phase, max. 62,5 Schritte / sec)
----------------------------	--

Digitalausgänge

Relais	4X (230 Vac, 5 [2] A)
--------	-----------------------

Batterieeingang

Puffer	24 V, mindestens 1 Ah
--------	-----------------------

Lager- und Betriebsbedingungen

Lagertemperatur	-25...+70 °C
Betriebstemperatur	-25...+60 °C
Luftfeuchtigkeit	10...90% (nichtkondensierend)
Schutzklasse	IP00 (ohne Gehäuse)

Stromversorgung

Versorgungsspannung	24 Vac \pm 20% oder 24 Vdc \pm 10%
Max. Leistungsaufnahme	50 VA (bei aktivem Motor)

Montageart

Montage	DIN-Schiene oder Wandmontage
Abmessungen	181 mm X 110 mm X 45 mm
Gewicht	220 g

Klemmenbelegung

Kl.-Nr.	Name	Beschreibung
1	G	Spannungsversorgung 24 Vac/dc (+)
2	G0	Spannungsversorgung 24 Vac/dc (-)
3	BAT	Pufferbatterie-Modul 24 V (+) mit Ladekontrolle
4	EARTH	Masse / Abschirmung
5	OUT2B	Ausgang Schrittmotor 2B
6	OUT2A	Ausgang Schrittmotor 2A
7	OUT1B	Ausgang Schrittmotor 1B
8	OUT1A	Ausgang Schrittmotor 1A
9	A	RS485, Leitung A +
10	B	RS485, Leitung B -
11	GNDX	RS485, Isolierte Masse
12	C4	Relais 4, Wechselkontakt
13	NO4	Relais 4, Arbeitskontakt
14	NC4	Relais 4, Ruhekontakt
15	C1	Relais 1, Wechselkontakt
16	NO1	Relais 1, Arbeitskontakt
17	C2	Relais 2, Wechselkontakt
18	NO2	Relais 2, Arbeitskontakt
19	C3	Relais 3, Wechselkontakt
20	NO3	Relais 3, Arbeitskontakt
21	T1	AIN1: Temperatureingang 1 (NTC10K, NTC20K, Pt1000)
22	GND	AIN1/2: Masse für Temperatureingänge 1 + 2
23	T2	AIN2: Temperatureingang 2 (NTC10K, NTC20K, Pt1000)
24	U1	AIN3: Universaleingang 1 (NTC10K, NTC20K, Pt1000, 0,5...4,5 V ratiometrisch, 0...10 V)
25	GND	AIN3/4: Masse für Universaleingänge 1 + 2
26	V5/15	AIN3/4: Sensor-Spannungsversorgung für Universaleingänge 1 + 2
27	U2	AIN3: Universaleingang 2 (NTC10K, NTC20K, Pt1000, 0,5...4,5 V ratiometrisch, 0...10 V)
28	R2	AIN6: Strom-/Spannungseingang 2 (0,5...4,5 V, 0...10 V, 4...20 mA)
29	GND	AIN6: Masse für Strom-/Spannungseingang 2
30	V5/15	AIN5/6: Sensor-Spannungsversorgung für Strom-/Spannungseingänge 1 + 2
31	GND	AIN5: Masse für Strom-/Spannungseingang 1
32	R1	AIN5: Strom-/Spannungseingang 1 (0,5...4,5 V, 0...10 V, 4...20 mA)
33	AO	AO1: Analogausgang 1 (0...10V)
34	GND	AO1: Masse für Analogausgang 1
35	GND	DI1/2/3: Masse für Digitaleingänge 1 + 2 + 3
36	D3	DI3: Digitaleingang 3 (log.1 = Kontakt offen oder 24 Vac/dc, log.0 = Kurzschluss oder < 2 Vac/dc)
37	D2	DI2: Digitaleingang 2 (log.1 = Kontakt offen oder 24 Vac/dc, log.0 = Kurzschluss oder < 2 Vac/dc)
38	D1	DI1: Digitaleingang 1 (log.1 = Kontakt offen oder 24 Vac/dc, log.0 = Kurzschluss oder < 2 Vac/dc)
39	GND	DI1/2/3: Masse für Digitaleingänge 1 + 2 + 3

Series SHC

SUPERHEAT CONTROLLER – OEM VERSION

PRODUCT DATA

GENERAL

SHC Electronic Superheat Controllers are suitable for use in compression refrigeration plants and heat pumps for the control of electronic expansion valves of the type EEV. Generally, the suction line pressure and the temperature of the superheated refrigerant are the critical measurement values. The superheat of the refrigerant is regulated at the evaporator's outlet.

Fig. 1. Circuit scheme

FEATURES

- Automatic adaptation to the evaporator's MSS
- Balancing of the lowest possible superheat
- Learning behavior with regards to the history of the operating points
- Automatic tracking of controller parameters
- Independent recognition of defrost requirements
- Termination of the defrost cycle commensurate with energy efficiency needs
- No external setpoint necessary!

TECHNICAL DATA

Analog outputs

Temperature	2X (PT1000, NTC10K, NTC20K)
Temperature/voltage	2X (PT1000, NTC10K, NTC20K, 0,5 ... 4,5 V, 0 ... 10 V)
Voltage/current	2X (0,5 ... 4,5 V, 0 ... 10 V, 4 ... 20 mA)

Analog output

Voltage	1X (0 ... 10 V)
---------	-----------------

Stepper motor outputs

For bipolar stepper motor	4X (12 V or 24 V, max. 800 mA per phase, max. 62,5 steps / sec)
---------------------------	---

Digital outputs

Relays	4X (230 Vac, 5 [2] A)
--------	-----------------------

Battery input

Buffer	24 V, min. 1 Ah
--------	-----------------

Ambient Storage and Operating Conditions

Storage temperature	-25...+70 °C
Operating temperature	-25...+60 °C
Relative humidity	10...90% (non-condensing)
Protection Class	IP00 (no housing)

Power Supply

Current	24 Vac ± 20% or 24 Vdc ± 10%
Max. power consumption	50 VA (when motor active)

Mounting

Mounting	DIN rail or wall mounting
Dimensions	181 mm X 110 mm X 45 mm
Weight	220 g

FUNCTION

The Honeywell SHC Controller operates with a 24 Vac/dc power supply. The controller uses the signals from the temperature sensor and the pressure sensor located at the evaporator outlet (alternatively: temperature sensors at the evaporator inlet and outlet) to determine the actual superheat of the refrigerant at the evaporator outlet and controls the EEV electronic expansion valve so as to ensure that the lowest possible superheat at the operating point is achieved.

To do this, the SHC Controller requires no external setpoint provided by operating personnel or another controller. The controller, itself, determines the optimal setpoint for the (given) operating point. By altering the operating point, the corresponding optimal setpoint for superheat of the refrigerant is determined and controlled. The SHC Controller always operates along the evaporator’s Minimal Stable Signal (MSS).

For every operating point, the PID parameters of the controller are automatically tracked and the control behavior optimized.

Because of the ability of the Honeywell SHC Controller to store historical operating data, it “learns,” over the course of time, the refrigeration circuit’s evaporator characteristics (MSS). In the event of a change in load in the refrigeration circuit, the SHC Controller is capable of immediately achieving the optimal operating point. This yields very dynamic control and resultant high energy efficiency.

Valve Control

The Honeywell SHC Controller is capable of driving EEV electronic expansion valves with stepped motors from various different manufacturers. However, the use of Honeywell EEV valves of the type EV2, EV3, and EV4 is to be preferred. Alternatively, electronic control valves can be driven with standard 0...10 V signals via the controller’s analog output. The control parameters of the given valve are to be adjusted at the controller.

Valve Parameters

Type of Drive

Type: Bipolar stepped motor, modulating actuator with 0...10 V analog output

Stepped Motor Parameters

Motor voltage: 12 V or 24 V
 Step frequency: 10...62,5 steps/sec
 Motor current: 80...800 mA
 Holding current: 0...100% of the motor current, in approx. 10% steps
 Max. no. of steps: 1...10,000 steps
 No. of opening steps: 1...1,000 steps
